

ABSTRACT OF THE DISCLOSURE

Disclosed is a control panel of a washing machine, in which buttons on a display panel are disposed independent from corresponding switches on a display substrate. The present invention includes a frame provided on a cabinet to form an exterior, a display panel on a front side of the frame to have at least one button formed thereon, a display substrate in
5 rear of the display panel to have at least one switch formed thereon, and a lever between the corresponding button and switch to operate the switch by receiving an external force applied to the button.
